

HCI Focus – Google Earth

Reflection 1: How does the Computer Graphics quality help or hinder the user's ability to interact with the software?

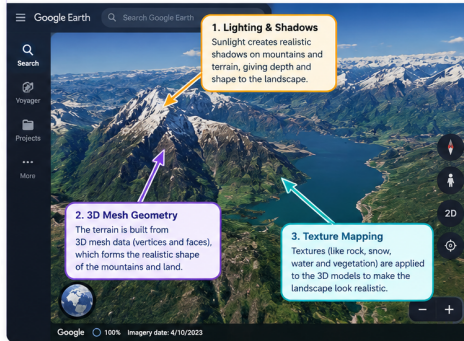

High-quality graphics such as realistic 3D views, lighting and shadows help users understand locations, depth and scale, making Google Earth easier and more engaging to explore.

However, detailed graphics may require more processing power and can make the software less responsive on lower-end devices.

Computer Graphics Focus – Google Earth

Slide 2 – CG Focus (Google Earth)

Key rendering and visual elements that create 3D space.

Reflection 2: What is one simple HCI change you would make to improve the user interface?

I would add clearer labels or tooltips for the main navigation controls, such as the compass, 2D/3D button and zoom controls. This would help new users understand what each control does and make Google Earth more beginner-friendly and easier to use.
